A Schiff base, namely, 4-[(2-hydroxy-3-methoxybenzylidene) amino] benzoic acid (L1), has been synthesized by the condensation reaction. It has been characterized by Fourier transform infrared spectroscopy, UV–vis spectroscopy, single-crystal X-ray diffraction, and DFT/B3LYP calculations. Single-crystal X-ray crystallographic analysis revealed that L1 exists in the zwitterionic (N–H

In light-emitting diode physics, the recombination of electrons and electron holes in a semiconductor produce light (or infrared radiation), a process called "electroluminescence". The wavelength of the light produced depends on the energy band gap of the semiconductors used. Since these materials have a high index of refraction, design features of the devices such as special optical coatings

In electronics, negative resistance (NR) is a property of some electrical circuits and devices in which an increase in voltage across the device's terminals results in a decrease in electric current through it.. This is in contrast to an ordinary resistor in which an increase of applied voltage causes a proportional increase in current due to Ohm's law, resulting in a positive resistance.

InGaN optoelectronics technologies are unique in that they have succeeded despite their common use of non-lattice-matched foreign substrates (such as sapphire and SiC) and the resulting high ($\approx 10^8 \text{ cm}^{-2}$) defect densities. 33, 34 However, even these now-ubiquitous InGaN optoelectronics technologies improve markedly when they make use

Bimetallic nanorods are important colloidal nanoparticles for optical applications, sensing, and light-enhanced catalysis due to their versatile plasmonic properties. However, tuning the plasmonic resonances is challenging as it requires a simultaneous control over the particle shape, shell thickness, and morphology. Here, we show that we have full control over these parameters by performing

This Handbook introduces a new, formal system of addressing quality issues in the Lighting Design Guide in Chapter 10, Quality of the Visual Environment. There are changes, too, in the illuminance categories, reduced from nine to seven and organized into three sets of visual tasks (simple, common, and special).
