Skin Barrier is the first book to be written exclusively by researchers for researchers as a convenient desktop reference. It focuses on several key aspects of the skin barrier including composition and structure and a description of the properties governing the diffusion of compounds across the skin. Although there has been a large number of laboratories involved in measuring percutaneous absorption over the past 15 to 20 years, it is only recently that there has been a general consensus in the scientific community regarding the development of standard protocols. Recognizing the importance of this, the authors have included two chapters detailing the protocol used in measuring and predicting percutaneous absorption and a discussion on the practical application of these techniques to solve associated problems. In order to provide the researcher and especially the student with access to more detailed information, the book features a comprehensive listing of references published over the past 10 years. Skin Barrier is the only desktop reference for dermatologists, cosmetologists, biochemists, biologists, and those in the pharmaceuticals industry, who need detailed and accurate information about the skin barrier on a daily basis. No R & D department should be without a copy.

dermatology professionals in practice and offers the perfect revision guide for those in training, from hospital-based doctors preparing for higher examinations to established physicians in their continuing professional development.

Vitiligo has been, until recently, a rather neglected area in dermatology and medicine. Patients complain about this situation, which has offered avenues to quacks, and has led to the near orphan status of the disease. The apparently, simple and poorly symptomatic presentation of the disease has been a strong disadvantage to its study, as compared to other common chronic skin disorders such as psoriasis and atopic dermatitis. Vitiligo is still considered by doctors as a non disease, a simple aesthetic problem. A good skin-based angle of attack is also lacking because generalized vitiligo is clearly epitomizing the view of skin diseases as simple targets of a systemic unknown dysregulation (diathesis), reflecting the Hippocratic doctrine. This view has mostly restricted vitiligo to the manifestation of an auto-immune diathesis in the past 30 years. Thus, skin events, which are easily detected using skin biopsies in most other situations, have not been precisely recorded, with the argument that a clinical diagnosis was sufficient for the management (or most commonly absence of management) of the patient. This book is an international effort to summarize the information gathered about this disorder at the clinical, pathophysiological and therapeutic levels. Its primary aim is to bridge current knowledge at the clinical and investigative level, to point to the many unsolved issues, and to delineate future priorities for research.
